Amplifier Controller 3000-01

General remarks

Call number assignment

The Intercom System is programmed in dialogue with the operator using a display-supported system.

In order to ensure fast, correct programming, before entering data, the operator should ensure that the system has been completely installed and correctly connected to the mains.

The entire Intercom System, i.e. all the components connected to the bus, can be programmed from any optional SIC/ICI 3000-01. This means that the AC 3000-01 can be programmed from any call station of your choice.

In order to prevent unauthorized access to the programming menu, this is protected by a code word.

Call number assignment

All new instruments are set in the factory for the call number „00“. In order to allow programming of an Amplifier Controller, the instrument must first be given its own call number. The assignment of call numbers is performed by setting the rotary switch at the AC 3000-01. The call number can be assigned using the rotary switches for tens and units within the range „0 - 99“. There is a status LED underneath the two rotary switches. This flashes when a different unit connected to the same bus already exists with the same number. If the status LED does not turn off after setting the call number, but continues to flash, an inadmissible number has been assigned, i.e. one that is already taken. In the case of single-bus systems, depending on how the call number length has been determined, the entered number either remains with two digits or is automatically supplemented by the two digits „00“ in front. In the case of multiple bus systems, the call number of all call stations always has four digits. The 2-digit AC call number is automatically supplemented by a prefix which is the same as the 2-digit bus number, e.g. AC call number „10“ at bus number „20“ results in the AC call number „2010“.

Remark

The assignment of call numbers can be performed when the system is either connected or disconnected from the mains. Read-in of the new call numbers is performed automatically, no reset process is therefore necessary.

Remote programming

Programming remark

Remote programming

All the units connected to the system bus can be programmed using any optional SIC/ICI 3000-01 Intercom call station.
The condition for remote programming is the correct

assignment of a call number for each unit. This is particularly important to note when first putting the system into service. If the power supply fails for one or both call stations during programming, both units return

to the starting status after an automatic reset.

Programming remark

In the programming menu of the AC 3000-01, the menu points appear in the sequence indicated on page 35. It is possible to scroll forwards through the menu with the R button, and backwards using the F button. In the sub-menus for configuration

selection, the R button is used to scroll forwards, while the F button takes you back to the previous menu point in the main menu.
In all menus, it is possible to change the menu point to the required function by entering „0, 1“ or a sequence of numbers.

Inputs do not have to be confirmed. When scrolling forwards, automatic intermediate storage of the inputs takes place. After leaving the programming mode (with the C button), the inputs are taken over into the memory by an automatic unit reset.

If you do not wish to change the value indicated in the display, scroll onwards **or**

R button scrolls forwards
F button scrolls back

change the value and then scroll onwards

Enter „0, 1“ or a number sequence

R button scrolls forwards
F button scrolls back

or

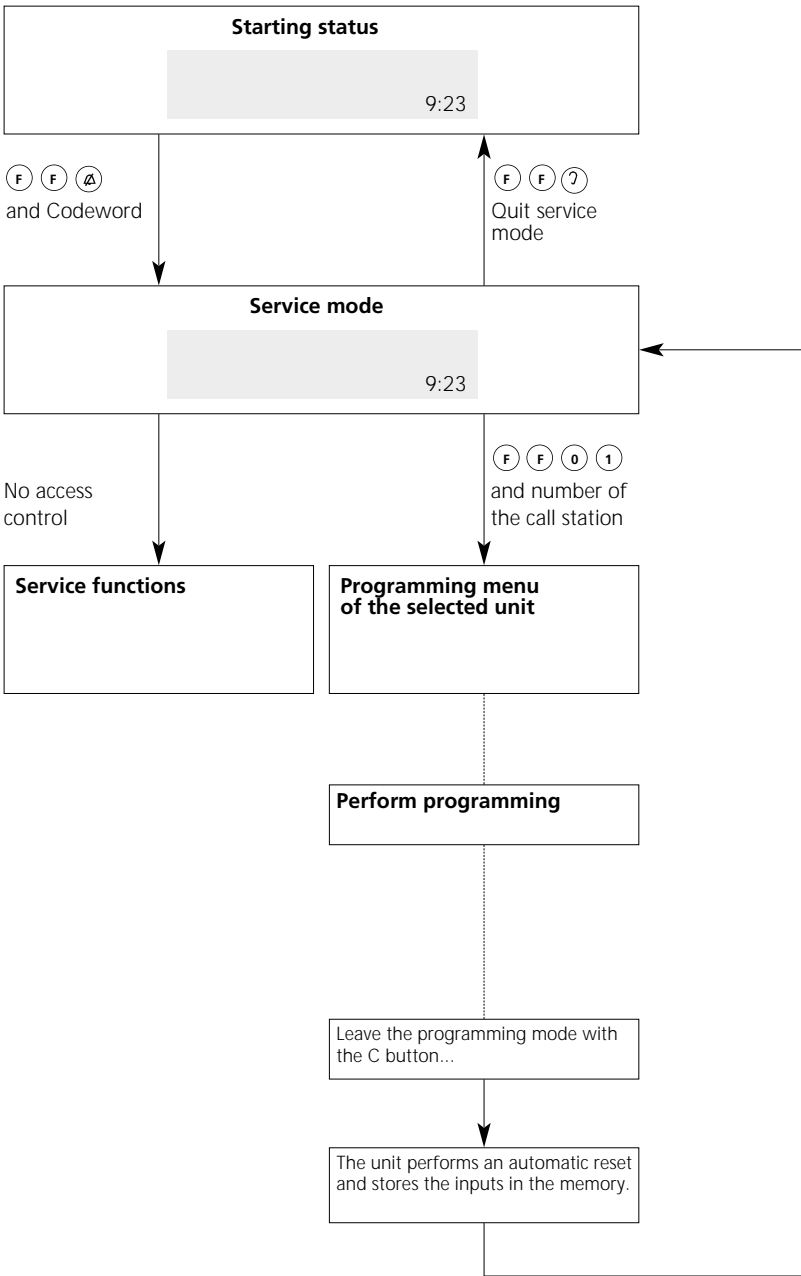

Remark

This procedure is identical for every point appearing in the programming menu.

In the submenus for configuration selection:
R button scrolls forwards
F button scrolls back into the main menu

Programming structure SIC/ICI 3000-01

Switching the service mode on and off

In order to branch into the programming mode of the AC 3000-01, it is first necessary to change into the service mode. Entry into the service mode is

protected by password. On delivery, the code word 1000 is set as a default value.

Note
If the code word is entered 3x incorrectly in consecutive sequence, the SIC/ICI 3000-01 is disabled for around 6 minutes.

Switching on the service mode

Remark:
The interval between pressing 2 buttons must not exceed 1.5 seconds. Your input must therefore be made quickly.

Press the F button 2x and press the call disable button.

Function

and

Switching the programming mode on and off

If you wish to change the default or personalized programming of any particular call station, this is only possible in the programming mode.

It is only possible to branch into the programming menu if every call station you wish to program already has its own call number. Before it is possible to activate

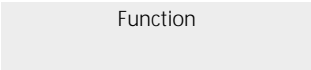

programming of the AC 3000-01, the SIC/ICI 3000-01 from which programming has to take place must be switched into the service mode.

Switching on the programming mode

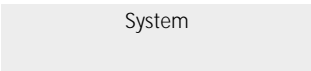

The programming menu of the AC is activated by pressing "F, F, 0, 1" and the call number of the AC 3000-0. Remote programming of a different unit, e.g. SIC, BC, is carried out by entering its call number.

Enter numbers "F, F, 0, 1"

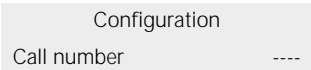

The display changes from

to

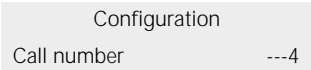

Remark:
The interval between pressing 2 buttons must not exceed 1.5 seconds. Your input must therefore be made quickly.

and

Enter the call number of the unit you wish to program (e.g. 4)

Switching off the programming mode

To terminate the programming sequence, leave the programming mode by actuating the C button.

Press the C button

The AC now performs an automatic reset and is then ready for operation.

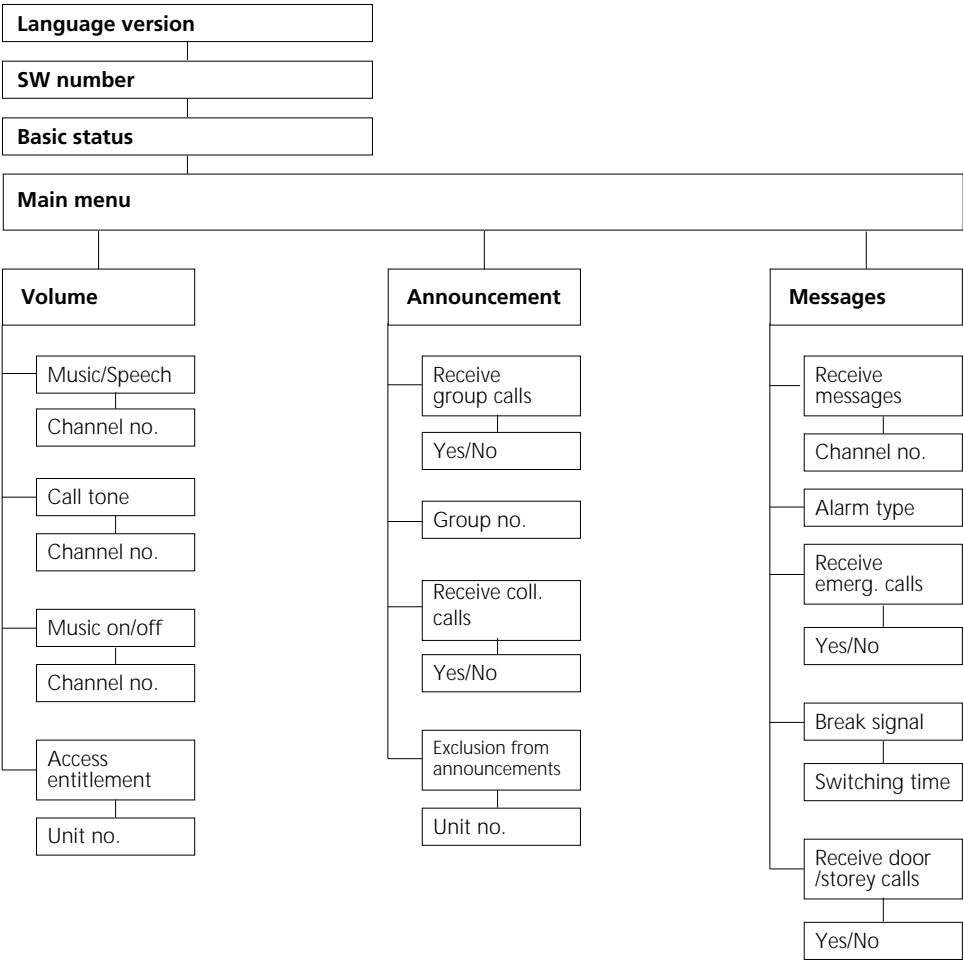

Display

After the reset, you are back in the service mode and can continue by programming another unit at the system bus by reactivating the programming mode with the new call number.

Note
After completion of programming, switch off the service mode manually. This safeguards against unauthorized access before the system automatically switches off the programming mode (appr. 10 minutes).

Programming structure AC 3000-01

Programmable menu points

Programmable menu points	Programming possibilities	Default setting

• Break signal table (max. 8 switching times)	---	---
• Entitlement to receive door/storey calls	yes/no	no

Volume control speech/music

Operating the volume control

To permit the volume to be altered, entitlement must have been granted. This is entered in the access table in the volume submenu.

Remark:
Volume control for music and speech is performed using the same channel number. For speech volume, adjust during a speech connection, for music volume when in the idle status.

Volume is set digitally in 16 stages. This means that it may be necessary to repeat this function several times to set the volume you require. On the lowest volume setting, the call tone volume is switched off altogether.

Basic volume control

The basic volume setting is set in the factory to a mean value and must be adjusted if required

using a small screwdriver. The potentiometer for basic setting is marked at the upper connecting terminals with „Level“. It is

possible to alter the volume as described below around this basic value.

Speech volume

You wish to alter the speech volume. Press the button F1 or F2, and then enter the channel

number defined for music/speech during programming in the „Volume submenu“.

The speech volume can only be altered during an existing call.

Press F, button 1 and then enter the channel number for a higher volume.

Press F, button 2 and then enter the channel number for a lower volume.

Volume control speech/music
Music on/off

Music volume

You wish to alter the music volume. Press the buttons F, 1 or F, 2, and then enter the channel

number defined for music/speech during programming in the „Volume submenu“.

The music volume can only be altered when there is no existing call and when the music function is switched on.

Press F, button 1 and then enter the channel number for a higher volume.

Press F, button 2 and then enter the channel number for a lower volume.

Music on/off

If you wish to switch the music on or off, press the buttons F, 1 or F, 2 and then the channel number which was defined during programming in the submenu for music volume on/off.

Press F, button 1 and then enter the channel number for music on.

Press F, button 2 and then enter the channel number for music off.

Volume control call tone
Speech control of the AC 3000-01

Volume control calling tone

If you wish to alter the volume of the call tone, press the buttons F, 1 or F, 2 and enter the channel number defined during programming in the „volume submenu“ for the call tone.

Press F, 1 and the channel number for a higher volume.

Press F, 2 and the channel number for a lower volume.

The call tone volume can only be altered when there is no call in progress.

Speech control

The AC 3000-01 is an amplifier unit without a keypad. It is therefore only possible for a call to be held between the SIC and an AC

in semi-duplex operation. The call must be manually controlled from a SIC using the Tiptronic button.

Call the AC, for example with the number 2003.

Enter the call number of the AC

At the called AC, a call signal sounds and the unit is automatically switched for speech. At the MVI 3000-0 connected to the AC, the green voice direction LED lights up. At the same time, the microphone disable LED lights up at the SIC.

Display

LED lights up

By actuating the Tiptronic button at the SIC/ICI the speech direction of both units can be reversed.

Actuate the Tiptronic button in order to change the speech direction.

By pressing the „C“ button, or putting down the receiver, the call is terminated and the semi-duplex mode is switched back off again.

Press the C button or replace the receiver.
