Using [mosquito netting](#) reduces the risk of malaria infection and other mosquito borne diseases by a factor of 10 to 20! Whether you are living in a high-risk area or perhaps are traveling to one, mosquito nets offer essential protection against mosquitoes, flies and other insects.

Each year, according to the World Health Organization, some 500 million people are infected with mosquito-borne illnesses: [dengue](#), [malaria](#), [yellow fever](#), and various forms of [encephalitis](#), including the West Nile virus. More than 2.5 million die, many of them young children. Mosquitoes are no joking manner.

**Mosquito
Netting**

This site will explore in detail the many methods and benefits of using mosquito netting as well as the various types of mosquito netting available and the ways of protecting yourself against mosquito borne diseases. We will talk about the legion of diseases that mosquitoes transmit to humans and the ways of preventing these diseases and

infections. Other topics include [mosquito predators](#) and how to [prevent mosquito breeding](#).

The proliferation of [dengue](#) alone is cause for alarm. In the 1950s, the WHO saw fewer than 1,000 cases annually of the sometimes fatal hemorrhagic variety. Today, the yearly average exceeds 500,000.

[West Nile virus](#) has emerged in recent years in temperate regions of Europe and North America, presenting a threat to public, equine, and animal health. The most serious manifestation of West Nile virus infection is fatal encephalitis (inflammation of the brain) in humans and horses, as well as mortality in certain domestic and wild

birds.

The World Health Organization estimates that yearly 300-500 million cases of [malaria](#) occur and more than 1 million people die of malaria. About 1,200 cases of malaria are diagnosed in the United States each year. Most cases in the United States are in immigrants and travelers returning from malaria-risk areas, mostly from sub-Saharan Africa and the Indian subcontinent.
